

MD EASIN BHUYIAN

AI AUTOMATION ENGINEER

Location: Hafar Al Batin, Saudi Arabia **Email:** mdeasinbhuyanrakib@gmail.com
Phone: +966 56 507 2169 **GitHub:** github.com/mdeasinbhuyanrakib-ctrl
Availability: Freelance projects

PROFILE

AI Automation Engineer focused on workflow automation, AI-powered systems and API integrations. I design automations that connect AI models, business software and data sources into processes that run reliably without manual effort — mapped first, automated second, and delivered with a diagram, an error path and a handover document.

CORE SKILLS

AI & Workflow Automation	Core
API Integrations	Core
Python	Working
n8n	Working
Make.com	Working
JavaScript	Working
SQL / PostgreSQL	Working

TOOLS & TECHNOLOGIES

REST APIs	Core
OpenAI API	Working
Google Sheets	Working
Git & GitHub	Working
Linux	Working
LangChain	Learning
TypeScript	Learning

Skill levels are indicative positioning, not certification scores.

SERVICES

- **AI Workflow Automation** — n8n, Make.com, OpenAI API, webhooks
 - **Business Process Automation** — Python, n8n, REST APIs, scheduling
 - **AI Agent Development** — OpenAI API, LangChain, vector search
- **API Integration** — REST, webhooks, OAuth, JSON
 - **Data & Spreadsheet Automation** — Google Sheets API, SQL, PostgreSQL
 - **Custom Automation Systems** — Python, JavaScript, TypeScript, Git

PROFESSIONAL DEVELOPMENT & CURRENT FOCUS

AI Automation Focus

Current

Workflow automation, AI agents, API integrations and business process improvement — deepening the toolset around n8n, Make.com, Python and the OpenAI API.

Portfolio Development

Building

Building practical automation projects that can be demonstrated end to end, with a clear workflow diagram and a stated outcome for each one.

Client-Ready Systems

Next

Turning validated workflows into maintainable solutions for real business use, with documentation, monitoring and a clear handover.

This section describes current professional development and focus areas. It is not employment history.

PORTFOLIO PROJECTS

AI Customer Support Automation

Planned

Support teams re-answer the same questions across channels. An AI layer answers from an approved knowledge base and escalates anything it is not confident about to a person.

Message → Intent detection → Knowledge base lookup → Draft reply → Confidence check → Send or escalate

n8n · OpenAI API · Vector search · Webhooks

Lead Generation Automation

Planned

Inbound leads arrive through several channels and are qualified by hand. A pipeline captures each lead, scores it against defined criteria, writes it to the CRM and triggers the right follow-up.

Form or ad → Validation → AI scoring → CRM record → Assigned owner → Follow-up sequence

Make.com · Webhooks · Google Sheets · CRM API

AI Email Automation

Planned

A shared inbox mixes invoices, support requests and sales enquiries. Messages are classified, labelled and routed, with an AI-drafted reply that a human approves before sending.

Inbox → Parse → Classify → Route to owner → Draft reply → Human approval → Send

Python · Gmail API · OpenAI API · n8n

Business Data Automation

Planned

Operational numbers live in separate exports. A scheduled pipeline pulls each source through its API, normalises the fields and writes one clean consolidated dataset.

Sources → API pull → Clean and normalise → Store → Scheduled refresh

Python · PostgreSQL · REST APIs · Cron

Projects listed above are planned concepts and are labelled by status. They are not completed client work.
